

ABSTRACT

A drinking container with an article holding clip is described. The clip is useful for attaching various objects to a drinking container, for example free coffee drink punch cards, business cards, cash, or even keys. Furthermore, by positioning the clip under a coffee mug handle, the attached objects are less likely to become dislodged accidentally. The present invention further relates to a method of efficiently and inexpensively incorporating a clip into the plastic components of a drinking container, by providing a plastic unitary construction including a liner, a rim, a handle, and the clip for connection with a stainless steel mug body.
